

Incident Response Reference Lite

Introduction

This document summarizes a minimal incident response flow for knowledge base acceptance. The goal is to verify that PDF content can be extracted, searched, and used for grounded answers.

Response Process Quick Reference

The core phases are Initiate, Assess, Contain, Remediate, and Retrospect. Initiate opens the situation room and assigns roles. Assess determines whether the event is real and estimates severity. Contain limits spread and impact. Remediate returns the environment to normal operations. Retrospect reviews the incident and records follow-up actions.

Incident Severities

High severity indicates broad or critical impact and usually requires immediate escalation. Medium severity indicates meaningful impact that may expand if left untreated. Low severity indicates limited impact and a clear recovery path.

Situation Room Roles

Situation Lead coordinates timing, escalation, and major decisions. Technical Lead verifies technical facts and drives diagnosis and remediation. Messenger communicates updates. Scribe records the timeline, actions, and decisions.

Recoverability Levels

Regular means recovery time is predictable with existing resources. Normal means recovery time is not predictable with existing resources. Supplemented means additional resources are needed but timing is still predictable. Extended means additional resources are required and timing remains uncertain. Not Recoverable means data has been lost or compromised and normal restoration is not possible.
